

How Ransomware Works

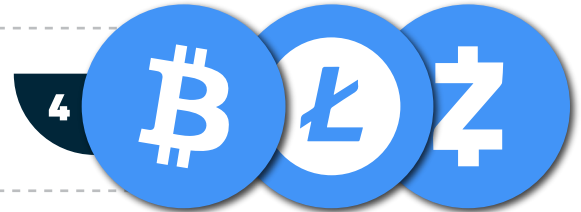

Hackers exploit vulnerabilities, such as outdated firmware, in the devices connected to your business network.

Ransomware takes advantage of a vulnerability in the operating system or software to run the infecting code.

The ransomware code encrypts the data on the system so that only the attacker can access it.

The attacker will demand a ransom payment, usually from \$120K to \$1.24M for small businesses, in Bitcoin.

Often, ransomware will spread to other devices on the network.

Protect Your Business with Secure Network

Secure Network from altafiber is an enterprise-grade cybersecurity solution that empowers your business with unmatched protection and a premium WiFi experience. Contact us today to learn more about how we can elevate your cybersecurity and network performance.
